

Full Court Analytics – Iteration 1

Lizzie Burton, Owen Johnson, Emmaline Mercer, Tierra Williams, Priscilla Zavala

Client: Bryce Woody, Josh Kelly

Full Court Analytics

Client: Bryce Woody

Basketball statistics ecosystem

- **Currently:** allows coaches/scouts to view player stats
- **What they want:** player-centralized site that serves as an outreach platform for athletes to connect with college coaches

THE FUTURE OF ANALYTICS AND VIDEO

Providing coaches with **industry leading** analytics, insights, and custom reporting. Trusted by one of the nation's Top Mid-Major programs.

Client Feedback

- Client against auto-gen doc ids, had to re-input data according to their preferred format (fname-lname-school-12345)
- Wants their site built with Bootstrap (component-based) to exactly resemble our site built with Tailwind (Utility)
 - Certain interactivity is very difficult to reproduce in tailwind, but possible
- Would like more information within the coach and school collections
- Wants our app deployed to Firebase Hosting

Iteration 1 Features

- Login and create an account
 - Stores user information in collection and auth user upon creation
- Coach Profile Page
- School Profile Page
 - Displays general and contact information for each school, and athletic office
 - Also links and information on athletic staff profiles (coach or assistant coach)
- Dashboard
 - Table displaying each school, some general info about the school, and their head coach
 - Search and filter through the schools

Planned Iteration 2 Features

- Users will be able to add additional info to their profile: bio, stats, education
- Dashboard search bar will have typeahead and search history
- Users will be able to add custom tags to schools and filter by them
- Users will be able to send pre-populated emails via our email template
- User contact with coaches will be tracked and viewable on coach profiles/
outreach history

Retrospection

- What does each team member think about this iteration? (i.e., lessons learnt)
- What kind of properties of quality software did you sacrifice for the sake of functional software?
 - We started coding before we were fully competent in the language/framework
 - Redundancy definitely happened (Inefficiency)
 - Querying an entire document to get just one field
 - Re-coding components on different pages instead of linking to components
 - Had to sacrifice edge cases to push out working features
- How do you plan to approach iteration 2?
 - Now that the project is setup, we will have more time to produce quality, clean code
 - Making sure to separate responsibilities to avoid merge conflicts
 - Refactor old code to make it modular, cleaner, and more testable
